

Project Design Phase

Problem – Solution Fit Template

Date	03 October 2026
Team ID	SWTID-2026-5730
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit

Customer / User	School IT helpdesk users – Students and Teachers.
Problem	The IT helpdesk receives incident requests such as Wi-Fi, projector, password/login, and slow or hanging computer issues. Manual classification takes time and may delay routing.
Existing Situation / Behaviour	Users submit support tickets with an issue description. The helpdesk needs to identify the appropriate Category and Subcategory.
Customer Pain	Manual classification effort, possible misclassification, delayed routing, and repeated handling of common issues.
Proposed Solution	Use ServiceNow Flow Designer to automatically classify a newly created IT ticket using predefined keyword conditions in the issue description.
How the Solution Solves the Problem	When a record is created, the flow checks the short description, evaluates predefined conditions, updates Category and Subcategory, and sends an email confirmation to the caller.
Classification Examples	Wi-Fi / Network → Network / Wi-Fi; Projector → Hardware / Projector; Password / Login → Access / Forgot Password; Slow / Hanging → Performance / Slow Computer.
Expected Customer Value	Reduced manual classification effort, standardized ticket data, improved routing, and automated confirmation to the caller.
Validation / Testing	“WiFi not working in library” → Network / Wi-Fi. “Projector not turning on” → Hardware / Projector. Email notification is also checked.
Maintainability	Classification conditions can be maintained in Flow Designer when keywords or categories change. Project configuration is stored in the “Project Update Set”.
