Problem – Solution Fit Template

Date	03 October 2026
Team ID	SWTID-2026-5730
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit

The school IT helpdesk receives incident requests such as Wi-Fi problems, projector problems, password/login issues, and slow or hanging computers. Manual classification can take extra time and may delay routing. The proposed solution uses ServiceNow Flow Designer to automatically classify a newly created incident using predefined keyword conditions and populate the appropriate Category and Subcategory. This directly addresses the classification and routing problem without requiring manual intervention.

Customer / User Problem

- Users need a simple way to submit an IT support issue with a short description.
- Helpdesk staff spend time identifying the correct category and subcategory for each new ticket.
- Manual classification can lead to inconsistent ticket data or delayed routing.
- Callers need confirmation that their request has been submitted.

Proposed Solution

When an incident record is created in the Incident Workflow table, ServiceNow Flow Designer checks the issue description using predefined conditions. The flow assigns standardized Category and Subcategory values and sends an automated email notification to the caller. The ticket remains stored in a structured format for helpdesk use and future maintenance.

Problem → Solution Fit

Observed problem	Project solution
Wi-Fi / network issue needs classification	Network → Wi-Fi
Projector issue needs classification	Hardware → Projector
Password / login issue needs classification	Access → Forgot Password
Slow / hanging computer issue needs classification	Performance → Slow Computer
Caller needs confirmation	Automated email sent to Caller → Email
Helpdesk needs standardized ticket data	Category, Subcategory and ticket fields are populated in the Incident Workflow table

Expected Fit / Value

- Reduces manual effort in ticket classification.
- Provides consistent Category and Subcategory values.
- Supports dependent Category/Subcategory logic.
- Automatically confirms ticket creation to the caller.
- Keeps the workflow maintainable because classification rules can be updated in Flow Designer.
