

Project Design Phase

Solution Architecture

Date	03 October 2026
Team ID	SWTID-2026-5730
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture

The solution architecture for Auto Ticket Classification describes how a school IT support ticket moves through the ServiceNow platform. The architecture uses the ServiceNow form and Incident Workflow table for ticket creation and storage, while Flow Designer provides the record-triggered automation, conditional classification, record updates, and email notification. The design is a no-code workflow and does not use an ML model or external API.

1. User / Caller	Student or Teacher Enters Caller + Short Description
2. Incident Workflow Table	Creates ticket with auto-generated Number and stores ticket fields
3. Flow Designer	Record Created trigger Condition: Category is Empty
4. Classification Conditions	WiFi → Network / Wi-Fi Projector → Hardware / Projector Password/Login → Access / Forgot Password Slow/Hanging → Performance / Slow Computer
5. Update Record	Category and Subcategory are populated with standardized values
6. Send Email	To: Caller → Email Ticket creation confirmation

Architecture Components

Component	Project-specific role
ServiceNow Form / User Interface	Used by the caller to create the IT support ticket.
Incident Workflow Table	Stores Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group and Assigned to.
Flow Designer	Runs automatically when a record is created and applies the configured classification workflow.
Conditional Logic	Checks predefined issue keywords and assigns the corresponding Category and Subcategory.

Update Record Action	Writes the classification values into the incident record.
Send Email Action	Sends the ticket confirmation email to the caller's email address.
Project Update Set	Stores project configuration for maintenance and transfer within ServiceNow.

Data Flow

1. Caller submits a new IT support ticket with Caller and Short Description.
2. The Incident Workflow record is created and receives an auto-generated ticket Number.
3. Flow Designer is triggered when the record is created.
4. The flow checks whether Category is empty and evaluates predefined keywords in the issue description.
5. The matching Category and Subcategory are assigned automatically.
6. The flow sends an automated ticket confirmation email to the caller.
7. The standardized ticket data remains stored in the Incident Workflow table for helpdesk handling and future maintenance.

Technology and Deployment Characteristics

Platform: ServiceNow. Automation: Flow Designer. Data store: Incident Workflow table within ServiceNow. External API: Not used. Machine Learning Model: Not used. File Storage: Not used separately. Deployment/transfer configuration: Project Update Set. Security relies on ServiceNow access controls.
